Feeding Records of True Bugs (Hemiptera: Heteroptera) from Wisconsin, Supplement

Andrew H. Williams

Abstract

In order to understand any animal and its habitat requirements, we must know what it eats. Reported here are observations of feeding by 27 species of true bugs (Hemiptera: Heteroptera) encountered in various habitats in Wisconsin over the years 2003–2014. This is the first report of *Anasa repetita* Heidemann (Coreidae) from Wisconsin.

Knowing what an animal eats is essential to our understanding of that animal and its habitat requirements. Over the years 2003–2014, I accumulated many observations of insects feeding in Wisconsin. These data are vouchered by hand-collected specimens given to the Insect Research Collection of the Entomology Department at University of Wisconsin - Madison.

These data are organized in two tables: Table 1 presents plant feeding records and Table 2, insect feeding records. Data for nymphs and adults are both included; nymphs were reared out. Some species appear in both tables. Only infrequently does one find a predator feeding; the predation event that presumably preceded feeding rarely is encountered. The animal feeding records probably represent predation, although in most instances a possibility of mere scavenging exists.

Presented here are 27 species in 9 families of bugs: Alydidae, Coreidae, Cydnidae, Lygaeidae, Miridae, Nabidae, Pentatomidae, Reduviidae, and Rhopalidae. All insects were collected by me, and all insects and plants were determined by me. This is the first report of *Anasa repetita* Heidemann (Coreidae) from Wisconsin; adults and nymphs were collected on 15 September 2006, at T4N R6W S34 in Grant County, beside Closing Dam Road by the Mississippi River at Eagle Valley Nature Preserve. Data reported here supplement similar data reported in Williams (2004). Plant nomenclature herein follows Gleason and Cronquist (1991).

Acknowledgments

I am grateful to the Kohler Trust for Preservation, which provided funding in 2005 and 2006 through a grant to Prairie Biotic Research, Inc., a non-profit organization with the mission of fostering basic biotic research by individuals in U.S. prairies and savannas. I thank B. A. Mandernack of Eagle Valley Nature Preserve for facilitating my research there, D. K. Young of the Entomology Department of the University of Wisconsin - Madison for providing essential laboratory space and encouragement, and R. A. Christoffel and E. Y. Williams for their assistance.

Table 1. Observations of Heteroptera feeding on plants. Bugs were adults unless otherwise indicated. Repeated insertion of mouthparts into flower openings was assumed to be feeding on nectar (N). An immobile bug with its mouthparts inserted into plant tissue was assumed to be feeding on developing seeds (DS), ripe seeds (RS), leaves, stems, flowers or fruits. Seeds fed upon were attached to plants. Stems fed upon were in or just below inflorescences. Determinations done by the author.

BUG SPECIES	PLANT SPECIES	PLANT FAMILY	PLANT STRUCTURE & NOTES
Aleydidae			
<i>Alydus eurinus</i> (Say)	<i>Asclepias syriaca</i> <i>Asclepias tuberosa</i> <i>Desmodium cuspidatum</i> <i>Pycnanthemum tenuifolium</i>	Asclepiadaceae Fabaceae Lamiaceae	N N DS N
<i>Alydus pilosulus</i> Herrick-Schaeffer	<i>Astragalus canadensis</i>	Fabaceae	RS, nymph, reared
