Background
- Nurses must be able to effectively identify, analyze, and synthesize evidence. (AACN, 2008; ACRL, 2000)
- Literature regarding confidence levels, self-efficacy, and information literacy skills was reviewed. (Freeman, 2004; Gross & Latham, 2012; Swenson-Britt & Reineck, 2009)
- Tools to assess confidence and self-efficacy of information literacy skills were explored. (Kurbanoglu, 2003; Stokes & Uqrhart, 2011; Geffert & Christensen, 1998)

Objective
To compare the information-seeking skills and self-efficacy levels of newly enrolled nursing students at the start of their first semester of coursework to their information-seeking skills and self-efficacy levels at the end of their first semester of coursework.

Methods
- Setting was a mid-sized, faith-based university located in the Midwest.
- Data was gathered from newly enrolled nursing students in a baccalaureate, masters, and doctorate in nursing practice program.
- The 28-item Information Literacy Self-Efficacy Scale (ILSES) developed in 2006 by Serap Kurbanoglu was administered to newly enrolled nursing students at the start and at the end of the fall 2012, summer 2013, and fall 2013 semesters.

Results – Self-Reported Confidence Levels
- The self-reported confidence level mean at the start of the semester (n=227) was 2.86 and 3.31 at the end of the semester (n=108).
- An independent-samples t test comparing the mean confidence level from the start of the semester participants to the end of the semester participants found a significant difference between the mean of the two groups (t(333) = 6.474, p < .05). The mean of the end of the semester group was significantly higher (m=3.31, sd=.63611) than the mean of the start of the semester group (m=2.86, sd=.58555).

Results – Self-Reported Information Skills Interventions Utilized
- Students reported using a variety of interventions to learn how to find information or use the library in their first semester of coursework.
- The intervention most reported was attendance at a library led lab session/class – 62% of all students attended a lab session and 43% attended a class. The second most reported intervention was the students themselves – 34% of all students reported teaching themselves.
- A multiple linear regression was calculated to predict participants’ self-reported confidence levels based on their use of 11 interventions. A significant regression equation was found (F(12,95) = 1.947, p < .038), with an R² of .197.
- Being helped by a classmate or friend was a significant predictor of confidence levels, p < .01. No other intervention was a significant predictor of end of the semester confidence.

Conclusions
- Nursing students in their first semester of coursework are fairly confident in their ability to locate information appropriate for assignments, projects, research, and papers.
- Utilizing a combination of information literacy skills interventions throughout the first semester of coursework resulted in a significant increase in students’ confidence in learning how to find information or use the library by the end of the semester.
- Peer teaching and learning can make a significant difference in students’ confidence in learning how to find information or use the library.
- Additional research is needed to correlate confidence in information-seeking skills to the actual information literacy skills of newly enrolled nursing students within their first semester of coursework.

Recommendations
- Think-pair-share and other active peer-to-peer learning strategies should be incorporated within library led lab sessions/classes.
- To better correlate students’ actual skill level with confidence level, self-efficacy and confidence assessment tools should be paired with actual skills assessment tools.
- Students are fairly confident in learning how to find information or use the library at the start of their first semester. Heightening awareness of their actual skill limitations might lead to increased participation in information skills interventions.
